Can you share what type of motherboard your //e that works with the color monitor is? ie Pal //e or International NTSC motherboard?

Is it connected directly to the video output RCA on the motherboard when it works in color?

I have one of these monitors and have had some trouble getting color from some of my apple's. Can't remember which ones work, I will try and have a test with it and let you know the result. I think it may be using NTSC but with 50Hz timing video.

/Rob
