Summary: bugs out, directory command in

[]

For those of you who still prefer a (relatively) small, efficient, convenient and friendly editor, I now have an improved version of the microEMACS ("umacs") I advertised in July. (No relation to the "3.7" version from James Turner - although they're both derived from the same original umacs by David Conroy.)

The source will compile on the ST (Megamax C) and also on Unix, MS-DOS, CP/M and VMS. (I've only tried it on the ST and BSD4.2.) Help is built-in. The ST version employs ALL the function keys for convenience (even HELP, UNDO and such) but is a TOS program (i.e. no graphics, mouse, or color). Commands include paragraph reformatting and bracket-matching. On Unix and MS-DOS there is access from inside umacs to the system command line, but on the ST there is no system command line to have access to... - instead I've added now commands to list a directory (the current one or by given pathname, including "foo.\*" type wildcards - as is available via the Ffirst() call), and a command to change the default pathname prefix (affects both directory listings AND file reading and writing). A few bugs were fixed, especially in the word wrap and paragraph reformatting.

The me.ttp file is 42897 bytes (including the built-in help!), and the source adds up to about 180K. I will send you both, plus some docs, and a "proff" executable if you send me a 3.5" disk and an appropriate SASE. (If you're in Europe, send two disks - one to cover postage - or a check in US dollars.) Some people add a few \$\$ to the requirements - I do not require it but if you feel rich enough... (I'm a graduate student with limited funds, and I've put a lot of time into this thing.)

I do NOT think POSTING the editor is a good idea.

My postal address:

Moshe Braner, Corson Hall, Cornell University, Ithaca NY 14853 USA
