I've been having problems trying to run my TI-820 serial printer on my Amiga. At 300 baud everything is fine but at 1200 I eventually get a buffer overflow condition. I have tried a few cable arrangements trying to get the TI to toggle CTS, etc but to no effect. I also tried to have the TI send XON/XOFF but that didn't work either. The TI does work at full speed on my old CP/M system. Without knowledge of the serial driver, I'm stuck. Anyone got some ideas? My dealer hasn't been any help after two weeks.
