I have several different applications where I would like to read or write
simple ascii files from msdos or pcdos floppies on my Kaypro 4. A format
utility that came with the Kaypro allows me to write to a VT180 disk which
I can read on the DEC Rainbow. The Rainbow has a program to read the CPM
file over to MSDOS. The process does not work the other direction so most
transfers have been via modem.

The Kaypro program also lists a few IBM formats but wouldn't they be a CPM
format and not PCDOS. Now I need to get documents to and from an IBM PC
that I do not have access to. I only get the floppies. Does anyone have a
conversion program or any other suggestions?
