Subject: TG-CD audio problem

Hey listers...

I recently bought a spare TG-CD unit off of eBay for \$1.99!!

It works fine except for one thing. It does not play audio tracks correctly. I can play games OK, but there is no music. The music track comes out as quiet static.

I tried hooking the CD unit itself up to the AC adapter alone and listening to an audio CD through the headphone jack with the same result.

What could cause a problem like this and how would I go about fixing it?

IT's not a huge deal because I already have a working TG-CD system, but for the \$1.99 that I spent, it would be *awesome* to have a fully functional backup unit available.

Is this audio thing a common problem among these units? What makes this happen?

-Nat
