Hi,

ARAnyM 1.1.0 the GNU/GPL ATARI Virtual Machine was released from :

<<http://github.com/aranym/aranym/releases>>

Does somebody knows how it should be used ? I'm maintaining the ARAnyM *miniPack* <<http://eureka.atari.org/miniPack.zip>> and it includes the v.1.0.2 version for the moment. If I replace the application's binary, it works nice, but there's no mouse pointer outside the ARAnyM's window. It means for me that ARAnyM can't be used as an OS hosted application anymore.

Is there somebody using v.1.1.0 of ARAnyM ? I tested both under macOS and GNU/Linux, but I don't understand its configuration.

Thanks for any help.

Best regards,

It works all right here on my Linux. Not sure what you mean "outside the window", you are supposed to press the mouse middle button to loose focus on AranyM since a long time ago.

Oh yes ! I didn't know, because v.1.0.2 ARAnyM wasn't using the middle
button of the mouse. It's a big change in the usage. I tested like you
under GNU/Linux and was able to use the mouse outside ARAnyM's window.

I also tested under macOS, and there's an incompatibility, because
pressing the middle button of the mouse is launching the dashboard ...

<http://en.wikipedia.org/wiki/Dashboard_%28macOS%29>

The usage of the mouse middle button is already dedicated under macOS.
So the new solution for moving the mouse outside ARAnyM's window doesn't
work. Dashboard is launched either with <F4> or with the middle button.
There's a big issue using ARAnyM on macOS. That doesn't work ...

Thanks for your reply =)

Best regards,

I finally found the solution to this issue under macOS, asking in the ARAnyM mailing-list. The way to exit the ARAnyM's window is to set :

```
"  
[STARTUP]  
GrabMouse = No  
"
```

in the "config" file. That totally fix the issue.

I hope it helps,

Regards,
