Hi,

ARAnyM http://aranym.github.io/ is the GNU/GPL ATARI Virtual Machine
from which a minimal configuration, the *miniPack* is distributed
http://eureka.atari.org/miniPack.zip miniPack is modified with
the new release of TeraDesk 4.08. It supports :

`Run_win` allows launching on PC with Windows
`MacAranym` allows launching on PPC Macintosh with OS X
`MacAranym JIT` allows launching on IntelMac with OS X
`run_x86.sh` allows launching on PC with x86-Linux
`run_ppc.sh` allows launching on Mac _and_ PS3 with PPC-Linux
`run_arm.sh` allows launching on Raspberry Pi with ARM-Linux

So Macintosh-PC-PlayStation3-RaspberryPi are all supported with
Windows, OS X and GNU/Linux.

This simple ARAnyM configuration is running on any machine.
Here is a screenshot http://eureka.atari.org/aranym.gif

Enjoy, it's yours =)
