I am interested in interfacing a synthesizer (probably a DX7) to a computer (Ile, PC etc.). I am beginning to understand what I need to do hardware-wise, I am still confused as to what software is available currently, and of what it is capable.

How many tracks can I control? How many voices can be controlled simultaneously on an instrument such as the DX7, and to what degree of independence? How versatile are these programs musically? Is there a void here software-wise?

I appreciate any response,

Don
