This may already have been covered, but I need to get some information about using the 800 as a terminal to a UNIX\* system. Three questions:

- 1) What's the best modem to use? How do you set it up?
- 2) Do you need emulation software? What's the best? Is there anything good in the Public Domain?
- 3) Does anyone have a working termcap/terminfo ?

Experience with setting this all up would also be appreciated. You could consider me a novice at all this since I've been SA strictly around big U\*X systems.

Please \*mail\* me any help you have and I'll summarize to the net. If you need to know we're running System V in various releases (why not?, we paid for it!).

Thanks in advance for any help.
