Rick,

 I'm using version 3.2 of MENU.COM and running into a glitch that
might be nasty for those trying to run a secure ZCPR3 with menus:

 on a menu with the 'exit to CP/M' option disabled,
 a control-C followed by a CR moves on to the next menu, even if
     a system menu ($) follows the current menu.

 I've heard a rumor that there is a new version of MENU.COM and .MAC.
Do the fixes address this problem? Is this a real problem, can anyone else
duplicate it?

   Don Shields c/o APA@CMU-C

Don,

The ^C problem has been addressed, and to my knowledge solved.
The current version of MENU is 3.5 (several versions from the old 3.2),
and you may want to look into getting a copy to see if your problem goes away.

  Rick
