Some friends are interested in buying an IBM PC or compatible, and a salesman in one of the stores they went to (in Toronto) was pushing the SEQUA. None of their friends have heard of it and they couldn't find it rated anywhere.

Does anyone out in netland know about this machine? Is it reliable? How PC-compatible is it? How easy is it to expand memory, add peripherals, etc.?

Please respond by mail as I don't usually read these newsgroups. If people are interested, I'll post a summary of the responses.

Thanks.
