Is this newsgroup still active? I tried reading it after I found about the TI discussions being moved here and found nothing. For starters, I just built a 32K expansion RAM for my TI 99/4A and found that it seems to play merry havoc with TV reception. Wrapping the box in aluminum foil seemed to not help at all. Any {hopefully inexpensive/free} ideas to help me cure this?

The memory map is thus:

0000 -> 1FFF	Console ROM
2000 -> 3FFF	Expansion RAM low bank
4000 -> 5FFF	Peripheral Driver programs
6000 -> 7FFF	Cartridge space
8000 -> 83FF	Console RAM
8400 -> 9FFF	Speech Synthesizer, Video Display Processor
A000 -> FFFF	Expansion RAM high bank

What does BASIC put in low Expansion RAM? If it is available to me, then I should see "13298 STACK
32000 PROGRAM BYTES FREE" instead of "24XXX PROGRAM". I am very curious about this.

For the purposes of discussion, it may be advisable to send answers to net.micro.zx.

Thanx,

Kchula-Rrit
