This if from this site which will have a link I believe
to the Moebuntu site.

Two years ago, Mangaka Linux was released, not sure if it still maintained, but in addition to colors, wallpapers it included open source software to animate, draw and other must-have tools (according to the authors) for anime/manga fans.

There were three releases of this pretty close together.

Releases, download links and checksums:

- 2015-09-21: Distribution Release: Linux Mangaka Mou
- 2015-08-16: Distribution Release: Linux Mangaka Koe
- 2015-06-21: Distribution Release: Linux Mangaka Nyu
- 2015-05-28: Development Release: Linux Mangaka Nyu Alpha
- 2009-12-02: Distribution Release: Linux Mangaka Chu
- More Mangaka releases...

Just search on the Linux Mangaka title and you should find a download site for that shortly. I would go with Distrowatch to download though for regular downloads they hand it off to the originating site or Sourceforge where lots of fine utility software is made available.

Personally I use a general purpose Linux, PCLinuxOS64 and before PCLinux I used Mandriva from 2006-2012. The 2011 release was not working on my hardware so I found a usable fork from Mandriva predecessor, Mandrake, for a while I had to leave the PCLinux to use Mageia, another fork from Mandriva.

But I also use KDE's Plasma which is a Desktop Environment that lets you use a wide variety of tools adaptable to the watching of anime and reading of manga. VLC for anime and Gwenview for manga. Any good drawing program(Krita) will let you create manga or even comix or comics if you have the talent and drive.

Anyone having trouble finding download site for any Linux distribution is free to ask me about that topic. If you are naive to Linux then the best bet is to join a Linux Users Group. Linux can be run on nearly any computer without even installing the system to disk if you know a few simple facts.

I think anyone using Linux as a serious desktop OS and not a play-toy uses a general purpose distribution. I use Gentoo myself; since it's a rolling-update distro, I haven't had to reinstall my system in twelve years and it's still up-to-date (except where I don't want it to be).

Basically, you can use any Linux program under any viable Linux desktop environment (although if it's a program specifically packaged with a different DE, you'll need its libraries too). There are a lot of desktop options. VLC and Gwenview aren't associated with any particular DE as far as I can recall.

I mention VLC and Gwenview because many Linux distributions come without those handy tools. Some even fail to have them in

their repositories but you can go out to the originating sites and get the packages in appropriate formats for nearly every distribution. Even in Android you can get a version of VLC. My tablet though was too slow to decode even the lowest resolution ..mkv file in a pleasing manner.

There are hundreds of Linux distributions, spread over five package format "families" (plus a few singletons that create their own package formats). It's a rare piece of software that covers even the five "root" distributions directly-- most of them just provide source and let the distros sort it out.

It exists for Windows too, or used to.

Really? Must be a really low-end processor. I've got a ~10-year-old laptop that handles 720p well enough most of the time. That's in mplayer, though, which has less overhead.

I think Android is the problem but the tablet is one built to the obstructive law that forbade OS replacement in tablets but not cell phones. Otherwise Debian or Ubuntu would be on it.

It is a Asus Transformer Pad 700 and I could have bought a lot of anime and or manga for what I paid for it a few years ago. But there is no way to test what sort of performance you will see until you try our a specific tool/OS/hardware in a field where there is lot of hiding of various factors. The next time I spend that money for an even better notebook faster cpus and with more memory especially dedicated graphics memory.

Some of the current tablets are much better in cpu speed, operating bandwidth specification and in price and they might do the trick. Some phone/tablets can handle games and anime I know but maybe it is a less encoded sort of format that the system can un-spool faster.

Meantime I have been spending more time making sure bootable disks and flash drives boot on the machine I haul along to the LUG meetings than get to spend watching Anime.

I have 2 Android pads - A Nexus 7 and a Pixel C. I use VLC on both and neither has any difficulty with mkv files.

That said - it depends very much on how many "a few" years is. Not so very long ago, a multi-core ARM chip was a rarity, and a single-core ARM would need a lot of help from the graphics chip to do the decoding on a complex video format in a timely manner.

I am thinking 2013 near the end of the model year and I think the main problem is the 32 bit bus. Right now I am too poor to get another tablet but cruise Craigs List looking for not too old machines that I might get to replace the HP Pavilion as I don't trust it very much longer. I think it is quad core at 1.6 GHz. I was going to install Linux on it but I have since learned it is impossible without some major changes to older firmware and the like.

That said with 1900 x 1200 resolution it is nearly ideal for looking at online manga or even manga copied to the additional memory chip. Other than that I would need more \$\$ to enjoy the plethora of stuff that is not simply free to access.

Note that this is an attack against WiFi. So here connected to DSL by Ethernet cable I am not much worried. When we use WiFi at various locations we are in danger of the KRACK attack but we know these are largely insecure but this will work on phones to decrypt data sent over WiFi and acquire it.

The KRACK attack works on all modern protected WiFi networks against both WPA1 and WPA2, and against cipher suites including WPA-TKIP, AES-CCMP, and GCMP). The list of products affected by some variant of attack includes Android, Linux, Apple, Windows, OpenBSD, MediaTek, Linksys, and more.

While almost every supported device and OS is at the risk of being attacked, it appears some operating systems could have far worse consequences, namely, Android and Linux. The wpa_supplicant is the WiFi client commonly used on Linux and Android (6.0 and above).
