Subject: UUCP for micros
Posted by ir320 on Tue, 01 Oct 1985 19:56:16 GMT

With all of the talk about UUCP for MSDOS systems going around, I just
want to clear something up. Many people, including myself, would like
a much simpler implementation than the one currently for 256k MSDos
systems. We just want to be able to use our CP/M computers to call our
nearest mainframe, identify ourselves as a "site" and get our mail or
send a batch of mail to that site to be put on the net. Any way to do
this? Most of us don't have the disk space for netnews anyway.
