A C64 systems routine at \$bdcd prints the decimal equivalent of a two byte integer. Here is how to use that code:

Ida \$\#Od
jsr \$ffd2
Ida \#\$c0
Idx \#\$00
jsr \$bdcd
rts
for the C128, substitute $\$ 8 \mathrm{e} 32$ at bank 15 for $\$$ bdcd. I've never had to do it but I'm sure that buried in the routine at $\$$ bdcd is a routine for converting 4 nibble hexidecimal to decimal text digits.
I think the routines suppreses leading zeroes.
