When I lived in Maryland, I found that the transport system had ben added since the last time I was there. I could take a train car, I suppose that is that they are, into D.C. However, if I wanted to go to another area on one of the other wheel spokes, I would have to go almost nto D.C., and then go back out to where I wanted to shop.

I asked my employer why that was ? He told me that the system was designed to get people to work and back. There had been talk for years to connect the spokes, but there was lots of Not in My Back Yard. So it never got done.
