The second home PC, 1992, was a Viglen with a 40MB HD.

40MB???

.... I just decided to delete the history from Microsoft Edge and was warned that there were 327 MB of data associated!

Bloat, bloat and even more bloat.

Systems aren't going to get that much faster anymore. Maybe people will actually learn again how to make good use of computer resources (one can hope...)

It's a variation of Parkinson's Law: programs grow to fill up all available disk space, memory, and CPU cycles.

More likely, marketroids will convince them to put up with ever-decreasing capability, since only that which lets the companies control them will have priority. But the screens will get prettier and prettier, so everything will be OK.

"The chocolate ration will be increased from seven grams to five."

I think Gareth hasn't learned about caches...
Using UNIX since v6 (1975)...
Use the BIG mirror service in the UK:
http://www.mirrorservice.org

Again, I query the motivation behind the way in which you respond?

Whatever, but has spent some time recently restoring a couple of Sparcstation 2 machines in the collection. Put in a 36Gb 2.5" scsi drive, modified bracket, put s socket on the idprom and fitted a bigger battery, cleaned & relubed the fans, same with the psu and Solaris 2.6, installed everything. Terminal into the serial port, but does support graphcal install as well.

The reason for this story?. With just 20Mb (Yes megabytes) of ram, is quite happy running cde or Sunos and draws just 35 watts from the line. Of course a bit slow, but a nearly 30 year old machine and could still do some serious work on it.

Just how far have we come in 30 years ?, sometimes wonder...

Chris
