I have 4 different terminal programs. The one that I use the most often with unix is The Terminal Emulator from APX. It allows you to use 80 column displays by pressing shift and START. This causes all of the characters on the rightmost side of a 80 column display to scroll onto the screen. It also includes the ability to upload, download and dump the screen to a disk, cassette or printer. Finally, it emulates an adm3a or vt100.
