I have a friend who has a handicap that makes pressing and holding of the shift key and then pressing another key very difficult. I know of programs for the IBM-PC that can make the shift key act like a toggle - press shift on/press shift off. Does anyone know of a program for the MODEL 1 that does the same thing?

Thanks, your help is appreciated.

Tell your friend to get a copy of the LDOS operating system for his Model I. (Assuming he has a disk drive setup). LDOS has a

keyboard driver program (KI/DVR) that will allow him to have the standard upper/lower case mode and then use the 'shift 0' as a caps lock mode.

LDOS can be purchased at your local Radio Shack Computer Cntr. or directly from Logical Systems Inc.

The price = \$69.00 ...I also believe they offer a stripped down version called 'smal-DOS" for \$39.00 or thereabouts.

For more info contact Logical Systems Inc. at;

Logical Systems Inc.
