The Osborne Executive destroys some of the Z80 alternate registers in the CBIOS. This could be the problem if your spelling checker program uses them and does not save the registers when calling BDOS or CBIOS. There is a fix for the Osborne Exec. users:

Filename Type Bytes CRC

Directory MICRO:

TPATCH.LBR.1 COM 1664 9126H

This is a program that patches the Osborne Exec. CBIOS so it preserves the Z80 alternate registers. It is run once when cold booting and remains thereafter until the next cold boot.
